# NUMERICAL PROBLEMS

Problem 14.1 Two identical coils A and B of 500 turns each has parallel planes such that 70% of flux produced by one coil links with the other. A current of 6 A flowing in coil A produces a flux of 0.06mWb in it. If the current in coil A changes from 10 A to - 10 A in 0.03s, calculate (a) the mutual inductance and (b) the e.m.f induced in coil B.

## Solution

$$N_A = N_B = 500$$

$$i_A = 6 A$$

$$i_A = 6 A$$
  $\Phi_A = 0.06 \text{ m Wb}$ 

$$\Phi_{\text{eff}}$$
 = 70% of  $\Phi_{\text{A}}$  = 0.70 x 0.06 m Wb = 0.042  $\times$  10  $^{-3}$  Wb

$$i_2 = -10 A$$

$$\Delta t = 0.03 \text{ sec}$$

(a) 
$$M = ?$$

(b) 
$$\varepsilon$$
=?

(a) Mutual inductance is given by

$$M = \frac{N_B \phi_{eff}}{i_A} = \frac{500 \times (0.042 \times 10^{-3})}{6}$$

$$M = 3.5 \text{ m H}$$

$$\Delta i = i_2 - i_1$$

$$\Delta i = -10 - 10$$

$$\Delta i = -20 \text{ A}$$

$$\Delta i = i_2 - i_1$$
  
 $\Delta i = -10 - 10$   
 $\Delta i = -20 A$ 

(b) Induced emf produced in coil B due to change in flux in coil A is;

$$\varepsilon = -M \left( \frac{\Delta i}{\Delta t} \right)_{p} = -\frac{\left( 3.5 \times 10^{-3} \right) \left( -20 \right)}{0.03}$$
  
 $\varepsilon = 2.33 \text{ V}$ 

Problem 14.2 A wheel with 12 metal spokes each 0.6 m long is rotated with a speed of 180 r.p.m in a plane normal to earth's magnetic field at a place. If the magnitude of the field is 0.6 G, what is the magnitude of induced e.m.f. between the axle and rim of the wheel?

### Solution

$$r = \ell/2 = 0.3 \text{ m}$$

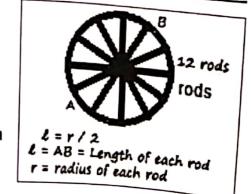

$$\omega$$
 = 180 r.p.m = 180 ( $\frac{2 \pi}{60}$ ) =  $6\pi$  rad/sec

$$B = 0.6 G = 0.6 \times 10^{-4} T$$

$$\varepsilon = 3$$

Emf produced due to motion of conductor inside a magnetic field is

$$\varepsilon = B \ell v$$
 ----- (1)

but  $v = r \omega$ 

$$\varepsilon = B \ell (r \omega)$$

$$\varepsilon = (0.6 \times 10^{-4})(0.6)(0.3 \times 6 \times 3.14)$$

Koracadomi

$$\Rightarrow$$

$$\varepsilon$$
 = 2.035 x 10 <sup>-4</sup> V

Problem 14.3 A circuit has 1000 turns enclosing a magnetic circuit 20cm<sup>2</sup> in section with 4 A current, the flux density is 1 Wb/m² and with 9 A current, it is 1.4 Wb/m². Find the mean value of the inductance between these current limits and the induced

e.m.f. if the current falls from 9 A to 4 A in 0.05 s.

$$A = 20 \text{ cm}^2$$

$$\frac{\varphi_1}{A}$$
 = 1 Wb/m<sup>2</sup> when i<sub>1</sub> = 4 A

$$\frac{\phi_2}{A} = 1.4 \text{ Wb/m}^2$$
 when  $i_2 = 9 \text{ A}$ 

when 
$$i_2 = 9 A$$

$$\Delta t = 0.05 \text{ sec}$$

$$\varepsilon = ?$$

$$L = ?$$

$$L = N \frac{\Delta \Phi}{\Delta i}$$

As 
$$\frac{\varphi_1}{A} = 1$$

$$\Phi_1 = 1 \times (20 \times 10^{-4} \text{ Wb}) = 20 \times 10^{-4} \text{ Wb}$$

Also 
$$\frac{\varphi_2}{A} = 1.4 \text{ Wb/m}^2$$

$$\Phi_2 = 1.4 \times (20 \times 10^{-4} \text{ Wb}) = 28 \times 10^{-4} \text{ Wb}$$

Change in flux

$$\Delta \varphi = \varphi_2 - \varphi_1 = (28 - 20) \times 10^{-4}$$

$$\Delta \phi = 8 \times 10^{-4} \text{ Wb}$$
  
 $\Delta i = i_2 - i_1 = 9 \text{ A} - 4 \text{ A}$ 

As

$$\Delta i = i_2 - i_1 = 9 A - 4$$

$$\Delta i = 5$$

(2)

Putting eq (2) and (3) in eq (1) we get

$$L = \frac{1000 (8 \times 10^{-4})}{5} = 0.16 \text{ H}$$

Now induced emf is given by the relation oracademy.com

$$\varepsilon = L \frac{\Delta i}{\Delta t} = \frac{0.16 \times 5}{0.05} = 16 \text{ V}$$

Problem 14.4 A coil of resistance 100 $\Omega$  is placed in a magnetic field of 1 mWb. The coil has 100 turns and a galvanometer of 400  $\Omega$  resistance is connected in series with it: find the average emf and the current if the coil is moved in 1/10th s from the given field to a field of 0.2 mWb.

Solution

$$R = 100 \Omega$$

$$\Phi_1 = 1 \text{ mWb}$$

$$N = 100$$
  $R_s = 400 \Omega$  (in series)

$$\Delta t = 0.1 \text{ sec}$$

$$\Phi_2 = 0.2 \text{ mWb}$$

According to Faraday's law of electromagnetic induction, induced emf "E"

$$\varepsilon = -N \frac{\Delta \Phi}{\Delta t} \tag{1}$$

$$\Delta \Phi = \Phi_2 - \Phi_1 = 0.2 - 1 = -0.8 \text{ mWb}$$

$$\varepsilon = -100 \frac{-0.8 \times 10^{-3}}{0.1} = 0.8 \text{ V}$$

Total resistance in series combination will be R + Rg

So the current 
$$i = \frac{\varepsilon}{R + R_g} = \frac{0.8}{100 + 400} = 1.6 \text{ mA}$$

Problem 14.5 A horizontal straight wire 10 m long extending from east to west is falling with a speed of 5 m/s at right angles to the horizontal component of earth's magnetic field 0.30 x 10<sup>-4</sup> Wb/m²(a)What is instantaneous value of emf induced in wire? (b) What is the direction of the emf? (c) Which end of the wire is at the higher electrical potential?

#### Solution

€ = 10 m

v = 5 m/sec

 $B = 0.30 \times 10^{-4} \text{Wb/m}^2$ 

 $\theta$  = 90° (Induced emf in a conductor is maximum when it moves perpendicular both to its own length and to the B field)

(a)  $\varepsilon = ?$ 

(b) Direction of  $\varepsilon = ?$ 

(c) Which end is at high potential?

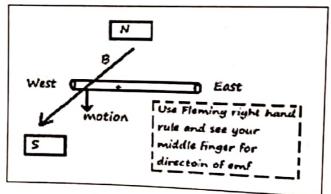

(a) Motional emf in a conductor moving in a magnetic field is

$$\varepsilon$$
 = Bev Sin $\theta$ 

$$\varepsilon = (0.30 \times 10^{-4}) (10)(5) \sin 90^{\circ}$$

$$\varepsilon = 1.5 \times 10^{-3} \text{ V}$$

- (b) Applying Fleming Right hand rule shows that direction of this induced emf is from east to west.
- (c) The end towards east will be at higher electric potential.

# Problem 14.6 Current in a circuit falls from 5 A to 0 A in 0.1 s. If an average emf of 200 V induced, give an estimate of the self-inductance of the circuit.

$$i_1 = 5 A$$

$$i_2 = 0 A$$

$$\Delta t = 0.1 s$$

Solution

⇒

$$\varepsilon = -L \frac{\Delta i}{\Delta t}$$

$$L = -\varepsilon \frac{\Delta t}{\Delta i} = -\frac{200 \times 0.1}{(-5)} = 4 \text{ H}$$

Problem 14.7 A long solenoid with 15 turns per cm has a small loop of area 2 cm<sup>2</sup> placed inside the solenoid normal to its axis. If the current carried by the solenoid changes steadily fron 2 A to 4 A in 0.1 s, what is the induced emf in the loop while the current is changing?

#### Solution

$$\Delta A = 2 \text{ cm}^2 = 2 \times 10^{-4} \text{ m}^2$$

$$\Delta i = 4 - 2 = 2 A$$

$$\Delta t = 0.1 \text{ sec}$$

$$\varepsilon = ?$$

Magnetic field inside a current carrying solenoid is

 $\Delta B = \mu_o$  n  $\Delta i$  = ( 4 x 3.14 x 10  $^{-7}$  ) ( 1500 ) ( 2 ) = 3.77 m T so emf  $\varepsilon$  for this single loop (N = 1) will be

$$\varepsilon = \frac{\Delta B A}{\Delta t} = \frac{(3.77 \times 10^{-3})(2 \times 10^{-4})}{0.1} = 7.54 \times 10^{-6} \text{ V}$$

problem 14.8 A rectangular wire loop of sides 8 cm and 2 cm with a small cut is moving out of a region of uniform magnetic field of magnitude 0.3 T directed normal to loop. What is emf developed across the cut if velocity of loop is 1 cm/sec in a direction normal to (a) longer side (b) shorter side of loop? For how long does induced voltage last in each case?

Solution

Width 
$$b = 2cm = 0.02m$$

$$N = 1$$

$$B = 0.3 T$$

$$\theta = 90^{\circ}$$

$$v = 1 cm/s = 0.01 m/s$$

(a) emf 
$$\varepsilon$$
=? for Longer side

(b) emf 
$$\varepsilon$$
= ? shorter side

$$\Delta t_1 = \Delta t_2 = ?$$

$$\varepsilon = B \ell v Sin\theta (\ell \text{ for longer side})$$

$$\varepsilon$$
 = ( 0.3 ) ( 0.08 ) (0.01) Sin 90  $^{\circ}$ 

$$\varepsilon$$
 = 2.4 x 10 <sup>-4</sup> V

$$\Delta \phi = BA = B(\ell b)$$
  
 $\Delta \phi = 0.3 (0.08 \times 0.02)$ 

$$\Delta \phi = 4.8 \times 10^{-4} \text{ Wb}$$

As 
$$\varepsilon = N \frac{\Delta d}{\Delta t}$$

$$\varepsilon = N \frac{\Delta \Phi}{\Delta t}$$
 re-arranging it, we get

$$\Rightarrow$$
  $\Delta t_1 = N \frac{\Delta \Phi}{\epsilon} = \frac{1 \times 4.8 \times 10^{-4}}{2.4 \times 10^{-4}} = 2 \text{ sec}$ 

(b) Similarly emf developed due to motion of wire loop inside magnetic field

$$\varepsilon = B b v Sin \theta$$

(b is used for shorter side)

$$\varepsilon$$
 = (0.3) (0.02) (0.01) Sin 90° = 0.6 x 10 <sup>-4</sup> V

$$\varepsilon = N \frac{\Delta \Phi}{\Delta t}$$

 $\varepsilon = N \frac{\Delta \Phi}{\Delta t}$  Koracademy.com  $\Delta t_2 = N \frac{\Delta \Phi}{\varepsilon} = \frac{1 \times 4.8 \times 10^{-4}}{0.6 \times 10^{-4}} = 8 \text{ sec}$ 

$$\Delta t_2 = N \frac{\Delta \Phi}{\varepsilon} = \frac{1 \times 4.8 \times 10^{-4}}{0.6 \times 10^{-4}} = 8 \text{ sec}$$

Problem 14.9 A 90mm length of wire moves with an upward velocity of 35 m/s between the poles of a magnet. The magnetic field is 80 mT directed to the right. If the resistance in the wire is 5 m $\Omega$  what are the magnitude and direction of the

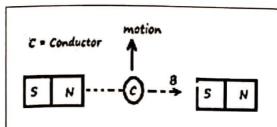

Karacadan

induced current?

Solution

$$B = 80 \text{ mT} = 80 \times 10^{-3} \text{ T}$$

$$R=5~m\Omega=0.005~\Omega$$

158

Using equation for motional emf is

$$\varepsilon$$
 = B & v Sin  $\theta$   
 $\varepsilon$  = (80 x 10<sup>-3</sup>) (0.09) (35) Sin 90 ° = 0.252 V

The current is 
$$i = \frac{\varepsilon}{R} = \frac{0.252}{0.005} = 50.4 \text{ A}$$

Direction of the current, according to Fleming Right hand rule, is into the plane of page (see figure).

Problem 14.10 A pair of adjacent coils has mutual inductance of 1.5 H. if current in one coil changes from 0 to 20A in 0.5 s, what is change of flux linkage with other coil? Solution

M = 1.5 H 
$$i_1 = 0$$
  $i_2 = 20A$  in  $\Delta t = 0.5$  sec

Change in current 
$$\Delta i = i_2 - i_1 = 20A$$
  $N(\Delta \phi) = ?$ 

$$\varepsilon = N \frac{\Delta \Phi}{\Delta t}$$
 ----- (1)

Also magnitude of emf due to mutual induction is given by

$$\varepsilon = M \frac{\Delta i}{\Delta t} - (2)$$

$$N \frac{\Delta \Phi}{\Delta t} = M \frac{\Delta i}{\Delta t}$$

By comparing; we get; 
$$N\frac{\Delta \Phi}{\Delta t} = M\frac{\Delta i}{\Delta t}$$
  
Multiplying both sides by  $\Delta t$   $N(\Delta \Phi) = M(\Delta i)$ 

Hence 
$$N(\Delta \phi) = M(\Delta i)$$
  
 $N(\Delta \phi) = 1.5 \times 20 = 30 \text{ Wb}$ 

Back emf 
$$\varepsilon_1$$
 = 120 V When  $\omega_1$  = 1680 r.p.m = 1680 x  $\frac{2\pi}{60}$  = 56  $\pi$  rad/sec

Back emf 
$$\varepsilon_2$$
 = ? When  $\omega_2$  = 3360 r.p.m = 3360 x  $\frac{2\pi}{60}$  = 112  $\pi$  rad/sec

In motor, back emf produced is given by equation  $\varepsilon$  = N A B  $\omega$  Sin $\theta$ 

First case: 
$$\varepsilon_1 = N A B \omega_1 Sin \theta$$
  
Second case:  $\varepsilon_2 = N A B \omega_2 Sin \theta$  (1)

$$\varepsilon_2 = \frac{\omega_2}{\omega_1} \ \varepsilon_1 = \frac{112 \,\pi}{56 \pi} \times 120 = 240 \text{ V}$$
