1.	What is the first step in the assessment of a patient presenting with symptoms of anxiety and depression in primary care?
	a. Start pharmacological treatment immediately
	b. Perform a comprehensive mental health assessment
	Refer to a psychiatrist
	d. Ignore if the symptoms are mild
2.	Which of the following is a common screening tool for depression in primary healthcare?
	a. General Anxiety Disorder-7 (GAD-7)
	b. Beck Depression Inventory (BDI)
	©Patient Health Questionnaire-9 (PHQ-9)
	d. Hamilton Rating Scale for Depression
3.	When managing anxiety in primary care, which non-pharmacological intervention is recommended as a first-line
	treatment?
	(a) Cognitive Behavioral Therapy (CBT)
	b. Electroconvulsive therapy (ECT)
	c. Antidepressant medications
	d. Surgery
4.	In which situation would it be most appropriate to refer a patient with anxiety and depression to a specialist?
	a. Mild symptoms that improve with lifestyle changes
	b. A single episode of anxiety that resolves after reassurance
	Severe, treatment-resistant depression
	d. Patient prefers non-pharmacological treatment
5.	What is the primary purpose of the Generalized Anxiety Disorder-7 (GAD-7) scale in a primary healthcare setting?
	a. To diagnose major depressive disorder
	b. To assess the severity of generalized anxiety disorder
	c. To evaluate the effectiveness of antidepressant medications
	d. To differentiate between anxiety and personality disorders
6.	Which of the following lifestyle modifications can be recommended to a patient suffering from mild anxiety and
	depression?
	a. Complete bed rest
	b. Regular physical exercise
	c. Avoiding social interactions
	d. Increasing alcohol intake to manage stress
	그 아이들 아는 그 그래 얼마 아니는 아이들이 어디지다. 아이들의 아이들의 사람들은 사람들이 아니는

7.	Which class of medications is commonly prescribed for the long-term management of both anxiety and
	depression?
	a. Benzodiazepines
	b. Beta-blockers Osalostina Saratania Rountaka Inhibitara (SSRIa)
(6. Selective Serotonin Reuptake Inhibitors (SSRIs)
	d. Antipsychotics What is the role of family support in managing anxiots and demandian in primary health area?
8.	What is the role of family support in managing anxiety and depression in primary healthcare? a. It has minimal impact on patient outcomes
,	B. It is essential, particularly in helping the patient adhere to treatment plans
(c. Family support should be avoided to ensure patient independence
	d. Only relevant in cases of severe mental illness
9.	What is the primary goal of conducting a risk assessment in mental health?
	a. To diagnose a specific psychiatric disorder
	b. To determine the level of risk for self-harm or harm to others
	c_To evaluate the patient's medical history
	(d) To assess the patient's cognitive abilities
10.	Which of the following factors is most important to assess during a mental health risk assessment?
	a. Patient's financial status
	b. Family history of mental illness
	C)The patient's current risk of suicide or violence
	d. educational background
11.	. What is a key aspect to explore when evaluating a patient's risk of suicide?
	a. Current social support system
(b Presence of suicidal ideation and any plan
	c. Patient's academic performance
	d. Dietary habits
12.	In a mental health risk assessment, which of the following is considered a protective factor against suicide?
	a. Substance abuse
	b. social isolation
(c)Strong family support
12	d. financial instability
13.	. What should be included in a mental health risk assessment for a patient who is showing signs of depression? a. Assessment of cognitive function only
	b. Exploration of the patient's access to means of self-harm
	c) Evaluation of only physical health symptoms
	d. A referral to a nutritionist
1/	. Which of the following is NOT typically assessed during a mental health risk assessment?
	a. History of suicidal thoughts
	b, Current living conditions
	c. Patient's political beliefs
	d. Substance abuse history
15	. Which of the following is a red flag symptom indicating severe depression in a primary care setting?
10.	A Mild irritability
	c. Suicidal ideation
40	d. Occasional fatigue
16	. A patient with anxiety presents with the following symptoms. Which one would be considered a red flag for severe
	anxiety requiring immediate intervention?
	a. Worrying about work deadlines
	b. Occasional feelings of restlessness
	C. Frequent panic attacks
	d. Difficulty concentrating during meetings.

1000	rding to guidelines, what is the first line treatment for will be used and developing a primary care setting?
	rding to guidelines, what is the first-line treatment for mild to moderate depression in a primary care setting? tipsychotic medications
Bellin Control	ychotherapy, especially cognitive-behavioral therapy (CBT)
	ectroconvulsive therapy (ECT)
	ospitalization for observation at its table to managing a patient with mild anxiety in a primary health care setting?
	enzodiazepine prescription festyle modifications and psychological interventions such as relaxation techniques
	nmediate referral to a psychiatrist
0. H	ospital admission for monitoring at is the properties at its the most important first step in evaluating a patient presenting with a headache in a primary care setting?
	tart with immediate imaging
	ssess the patient's pain score Obtain a detailed history and perform a thorough physical examination
@ C	rescribe analgesics immediately
0. 14/6	ich of the following symptoms associated with headache would be considered a red flag, warranting urgent
	ther investigation?
	Headache with photophobia and nausea
	Chronic headache that worsens in the evening
	Sudden onset of a "thunderclap" headache
0,0	Mild tension-type headache lasting for several hours
21 An	rimary care physician should consider imaging for a headache patient in which of the following situations?
a. A	A headache that worsens with stress
(b) F	Persistent headache in a patient with no previous headache history
C. F	Recurrent migraine episodes that respond to treatment
d. N	Mild tension-type headaches occurring once a month
22. Ap	patient presents with a headache that began suddenly, is extremely intense, and is described as "the worst
hea	adache of their life." What is the most appropriate next step in management?
a. F	Reassure the patient and prescribe NSAIDs
	Start treatment for migraine
_	Jrgently refer for neuroimaging to rule out subarachnoid hemorrhage
	Monitor the patient over the next 48 hours
	0-year-old woman presents with intermittent, sharp headaches associated with tearing and redness of the eyes.
	uroimaging is negative. Which investigation is most helpful in confirming the diagnosis of cluster headache?
_	Blood test for inflammatory markers
	Detailed history and headache episodes
	Sinus X-ray
d. L	umbar puncture
	nich of the following is a critical red flag in a patient with a headache and requires immediate referral to a
	urologist or emergency care?
	Headache with aura and sensitivity to light
	Headache with visual loss, limb weakness, or seizures
	pisodic headache lasting a few hours
d. F	leadache that improves with analgesics
25. A4	-year-old boy presents with fever for 5 days, bilateral conjunctival injection, erythema of lips and oral mucosa,
and	cervical lymphadenopathy. Laboratory results show elevated CRP and ESR. What is the most likely diagnosis?
(a)	Kawasaki disease
b.	Scarlet fever
c.	Measles
	Infectious mononucleosis
	마르크로 마르크로 보다 (1975) [17] (1975) - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - In Spuin (1985) - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1985 - 1

- 26. A 7-year-old girl diagnosed with Kawasaki disease has received intravenous immunoglobulin (IVIG) and aspirin therapy. On day 7, her fever returns, and echocardiogram shows coronary artery dilation. What is the next best step?

 a. Repeat IVIG therapy
 b. Add corticosteroids
 c. Increase aspirin dose
 d Initiate anticoagulation therapy

 27. A 2-year-old boy presents with 3 days of fever, rash, and swelling of hands and feet. Laboratory results show
- 27. A 2-year-old boy presents with 3 days of fever, rash, and swelling of hands and feet. Laboratory results show elevated inflammatory markers, but no coronary artery involvement is detected on echocardiogram. What is the key factor in determining the need for IVIG therapy?
 - a.) Presence of coronary artery aneurysm
 - b. Duration of fever
 - c. Age of the patient
 - d. Inflammatory marker levels

- Short stature
- Macrocephaly
- Hepatosplenomegaly
- Developmental delay

Urinary glycosaminoglycan (GAG) analysis reveals elevated levels of dermatan sulfate and heparan sulfate. What is the most likely diagnosis?

- a. Hurler syndrome (MPS I)
- b. Hunter syndrome (MPS II)
- c. Sanfilippo syndrome (MPS III)
- (d.) Morquio syndrome (MPS IV)

- Progressive hearing loss
- Speech impairment
- Aggressive behavior
- Joint stiffness
- Cardiac murmur Which treatment option would you consider?
- a. Enzyme replacement therapy (ERT) with idursulfase
- (b.) Hematopoietic stem cell transplantation (HSCT)
- c. Gene therapy
- d. Supportive care only

30. A 6-month-old infant presents with:

- Hypoglycemia
- Lactic acidosis
- Hepatomegaly
- Failure to thrive

- Low glucose
- Elevated lactate
- Elevated liver enzymes
- Normal ammonia

Which GSD type is most likely?

- a von Gierke disease (GSD I)
- b. Pompe disease (GSD II)
- c. Cori disease (GSD III)
- d. McArdle disease (GSD V)

- ヘェイ だしょじ ラヤイ

	se (GSD III) presents with:	
- Muscle weakness		
- Cardiomegaly	*	
- Short stature		
- Hepatomegaly Which treatmen	nt option would you consider?	
Dietary management with frequ	eent meals	
 b. Enzyme replacement therapy (ERT)	
c. Gene therapy		
d. Liver transplantation		
32. A 2-year-old child with Down sy	ndrome presents with:	
 Congestive heart failure 		
- Short stature		
- Developmental delay		
- Flat facial profile		
Which of the following is the most	common congenital heart defect associated with Down syndrome?	
a. Atrial septal defect (ASD)		
(b) Ventricular septal defect (VSD		
c. Tetralogy of Fallot		
d. Complete atrioventricular can	al defect (CAVC)	
33. A 10-year-old child with Down s	syndrome presents with:	
- Progressive hearing loss		
- Speech impairment		
- Sleep apnea		
- Obesity		
Which of the following intervention	ns would you recommend?	
a. Hearing aids		
b. Speech therapy		
c. Sleep study and CPAP		
All of the above		
34. A 12-year-old child presents wi	th:	
- Recurrent abdominal pain	선물 수 있는 것이 없는 것이다. 그런 것이 없는 것이 없는 것이 없는 것이 없는 것이 없 	
- Nausea and vomiting		
- Photosensitivity		
 Neurological symptoms (e.g., 	seizures, weakness)	
Lab results show:		
- Elevated porphobilinogen (PB	G)	
- Elevated urine porphyrins	X	
Which type of porphyria is mos		
 a. Acute intermittent porphyria (AIP)	
b. Cutaneous porphyria		
Variegate porphyria	대통령 (1907년 - 1945년) 전에 대한 경영 (1907년 - 1907년 - 1907년 - 1907년

69. A	d passing black tarry stools. He is hypotensive (BP 90/60 mmHg) and tachycardic (HR 110 bpm). After stabilize
	s vitals with IV fluids, what is the next best step in management?
a.	Order an abdominal CT scan
b.	Initiate oral PPI therapy
C.	Perform blood transfusion
(d.)	[[마양마그어님의 [마양마그리] [[마양마그리] [[마양마그] [[마양] [[마양마그] [[마양마그] [[마양마그] [[마양마그] [[마양] [[h] [[h] [[h] [[h] [[h] [[h] [[h] [[
	35-year-old woman with known ulcerative colitis presents with worsening diarrhea, abdominal pain, and recta
	eeding over the last 10 days. She is passing 10-12 bloody stools per day. On examination, she is febrile (38.5°C
	chycardic (HR 110 bpm), and her abdomen is tender with guarding. What is the most appropriate next step in
	anagement?
a:	Increase her oral mesalamine dose
(p,	
C.	Initiate IV Paracetamol
d.	Perform colonoscopy immediately
	25-year-old woman presents to the emergency department 12 hours after ingesting 20 grams of paracetamol
su	icide attempt. She has no symptoms yet but is concerned. What is the most important next step in manageme
a.	Measure serum paracetamol levels
b.	Start Activated Charcoal
(C)	명의회사가 하는 사람이 있는 것이 마다를 하는 것이 되었다. 그는
d.	Administer IV fluids
	30-year-old woman, 32 weeks pregnant, comes to the clinic with complaints of fever, abdominal pain, and
1 m 54 m	indice. She recently returned from a trip to a rural area where she drank untreated water. Laboratory results s
	evated liver enzymes (AST: 600 U/L, ALT: 650 U/L), total bilirubin of 5.0 mg/dL, and positive anti-HEV IgM.Whi
co	mplication is this patient at highest risk for due to her hepatitis E infection during pregnancy?
(a)	Hepatic Encephalopathy
b.	Preterm labor
C.	Fetal growth restriction
d.	Maternal thrombosis
73. A 5	50-year-old male with diabetes and hypertension is started on a four-drug regimen for tuberculosis, including
iso	niazid, rifampicin, ethambutol, and pyrazinamide. After two months, he presents with increased fatigue,
•	lowish discoloration of the skin, and dark urine. Laboratory tests reveal elevated liver enzymes (ALT: 450 U/L
AS	T: 400 U/L, total bilirubin: 6.0 mg/dL). Which of the following is the most appropriate next step in managemen
a.	Administer N-acetylcysteine
b.	Perform liver biopsy
Ç.	Discontinue all antitubercular medications
(9)	Start an alternative tuberculosis regimen without isoniazid
74. A 1	5-year-old female presents with a visible spinal curvature and complains of back pain. On examination, she
sho	ows a thoracic curvature with forward rounding of the spine. What is the most appropriate initial imaging
mo	dality to assess the severity of her kyphoscoliosis?
(a.)	CT scan
b.	MRI
c.	X-ray
d.	Ultrasound
ACID 1	patient with kyphoscoliosis experiences progressive difficulty in breathing and chronic fatigue. Which of th
	owing is the primary reason for respiratory compromise in kyphoscoliosis?
	Increased lung compliance
a.	Restricted chest wall expansion
