

MBBS 5th Prof.
Block-O
(CVS-3 and Respiration -3)

Time: 120 min

Marks: 120

MCQs

- Write your Roll No. on Scoring sheet & Question Paper.
 - Select the best answer from given choices by filling the circle in Scoring sheet as ●
1. A 60 year old lady presented to clinic with shortness of breath on lying flat. She is diabetic and has a history of MI 3 years back. She admitted that she had stopped taking her medication for few weeks. On examination she is having a regular pulse of 84/min with blood pressure of 130/90. She has pedal edema, raised JVP and bilateral basal crepitus in chest. Which investigations you would like to confirm your diagnosis?
 - a. ECG
 - b. ECHO
 - c. CHEST X-RAY
 - d. TSH
 - e. None of the above
 2. All the following medicines are used for heart failure except:
 - a. Metoprolol
 - b. Ramipril
 - c. Spironolactone
 - d. Nifedipine
 - e. Valsartan
 3. All the following are precipitating factor for heart failure except:
 - a. Ischemia
 - b. Poor drug compliance
 - c. Smoking
 - d. Infection
 - e. Myocardial infarction
 4. All of the following are risk factors for coronary artery disease except:
 - a. Smoking
 - b. Hyperlipidemia
 - c. Fasting
 - d. Hypertension
 - e. Diabetes
 5. A 58 years old diabetic patient presented with severe central chest pain for the last 4 hours. ECG showed ST Elevation in V₁, V₂, V₃ and V₄. What is the best treatment option?
 - a. Morphine
 - b. Angiography
 - c. Streptokinase
 - d. Metoprolol
 - e. Oxygen
 6. A 65 years old patient having history of ischemic heart disease presented with palpitation and drowsiness. On examination he is tachycardia and having BP of 70/50. ECG showed atrial fibrillation with fast ventricular rate. What is best treatment option?
 - a. DC Cardioversion
 - b. Metoprolol
 - c. Amiodarone
 - d. Diltiazem
 - e. Digoxin
 7. A 23 years old primigravida presented with palpitation in clinic. She is hemodynamically stable with heart rate of 168/min. ECG done showing supraventricular tachycardia. What is the first line treatment?
 - a. Metoprolol
 - b. Amiodarone
 - c. Adenosine
 - d. Verapamil
 - e. Amiodarone
 8. A 23 years female presented with shortness of breath. She is married and given birth to a male baby 2 months ago. On examination she has a weak pulse with BP of 100/70. She has generalized swelling, raised JVP and bilateral crepitus up to mid zone of chest. What is the most likely diagnosis?
 - a. Acute exacerbation of asthma
 - b. Cor pulmonale
 - c. Pulmonary embolism
 - d. Peri partum cardiomyopathy
 - e. Pneumonia
 9. A 70 years old Diabetic, Post CABG patient came to HEART FAILURE Clinic for follow up. According to him, he perform his daily activities comfortably but feels breathlessness whenever he do exertion more than ordinary activities. His medical record showed that he has LV Ejection fraction of 36%. What is functional class of this patient according to NYHA Classification?
 - a. NYHA I
 - b. NYHA II
 - c. NYHA III
 - d. NYHA IV
 - e. None of the above

10. Which is not a major criteria according to modified Jones criteria for acute rheumatic fever?
- Migratory polyarthritis
 - Fever
 - Chorea
 - Subcutaneous nodules
 - Carditis
11. Normal PR interval in Electrocardiogram?
- 100-120 msec
 - Less than 120 msec
 - 180-220 msec
 - Less than 200 msec
 - None of the above
12. Standard calibration (setting) for electrocardiogram is?
- Speed 15 mm/sec voltage 05 mm/mv
 - Speed 20 mm/sec voltage 10 mm/mv
 - Speed 25 mm/sec voltage 10 mm/mv
 - Speed 25 mm/sec voltage 05 mm/mv
 - Speed 15 mm/sec voltage 10 mm/mv
13. The diagnostic investigation of choice for Acute Rheumatic fever is?
- RA factor level
 - Anti CCP
 - LSR
 - None of above
 - All of the above
14. All of the following are complications of uncontrolled blood pressure except
- Cerebrovascular accident
 - Encephalopathy
 - Kidneys
 - Intracerebral bleed
 - All of above
15. Target blood pressure for a coronary artery disease patient?
- 120/80
 - 130/80
 - 140/90
 - 150/90
 - None of above
16. Drug of choice for uncontrolled blood pressure during pregnancy is :
- Methadopa
 - Isosorbide
 - Verapamil
 - Methyldopa
 - None of above
17. A 40 years old diabetic patient presented with severe central chest pain in emergency, ECG done showing ST depression in inferior leads. Lab investigations showed raised troponin level. What is the diagnosis?
- ST elevation MI (STEMI)
 - Non ST elevation MI (NSTEMI)
 - UNSTABLE ANGINA
 - NONE OF ABOVE
18. Which is true regarding causes of severe chest pain
- Anterior wall MI
 - Aortic dissection
 - Pulmonary infarction
 - Sabre Angina
 - All of the above
19. All of the following are causes of pericardial effusion except
- Tuberculosis
 - Brucellosis
 - Dressler syndrome
 - Malignant tumors
 - Systemic lupus erythematosus
20. All of the following are common complication of myocardial infarction except
- Ventricular septal defect
 - Mitral regurgitation
 - Heart block
 - Aortic regurgitation
 - Ventricular free wall rupture
21. Which of the following form the major criteria for diagnosis of Acute Rheumatic Fever
- Previous history of RF
 - Arthralgia
 - Increased ESR/CRP
 - Fever
 - None of the above
22. Incidence of arthritis in Acute Rheumatic Fever
- 60-80%
 - 24-40 %
 - 20-30 %
 - 5-10 %
 - 10-20%

23. All are true about erythema marginatum in Rheumatic Fever except
- Bathing suit distribution
 - Early manifestaion
 - Puritic lesion
 - Seen rarely
24. Best drug for criteria for diagnosing RF
- Benathine penicillin for Rheumatic Fever
 - Erythromycin
 - Gentamycin
 - Dexamethasone
 - Omeprazole
25. All are true for Arthritis in Acute Rheumatic Fever except
- Non deforming
 - Associated with raised ASO titer
 - Lasts for 3-6 weeks in untreated cases
 - Migratory Arthritis
26. All of the following are true for chorea in Rheumatic Fever except
- Emotional liability is usually present
 - Self limiting
 - Cranial nerve palsies, sensory changes may be present
 - Treated with haloperidol
27. All of the following criteria for diagnosing RF
- Analgesics have mortality benefit in heart failure patients except
 - Atenopril
 - Enalapril
 - Spironolactone
 - Verapamil
 - Bisoprolol
28. All of the following investigations are done in patient presented with chest pain except
- ECG
 - Hopponin levels
 - Chest x ray
 - TSH
 - CK-MB
29. All of the following are signs of heart failure except
- Dyspnoea
 - Swelling of feet
 - Clubbing of nails
 - Guttae on nail
30. Which of the following is a sign of infective endocarditis
- Atrial fibrillation
 - erythema marginatum
 - cyanosis
 - Janeway lesions
31. All of the following are the common signs of infective endocarditis except
- Chorea
 - Splinter hemorrhages
 - Splenomegaly
 - Retinal detachment
 - Osser nodes
 - Clubbing
32. All of the following are the common signs of Rheumatic fever except
- Chorea
 - Splenomegaly
 - Mitraly Arthritis
 - Carditis
 - crythema marginatum
33. Target blood pressure for a Chronic Kidney disease patient?
- 120/80
 - 130/80
 - 140/90
 - 140/80
 - None of above
34. A 40 years old diabetic patient presented with severe central chest pain for the last 6 hours in emergency. ECG is normal. Which investigation you would like to do:
- ECHO
 - Troponin I
 - Angiography
 - None of above
35. Which is true regarding causes of Heart Failure?
- Coronary artery disease
 - Diabetes
 - Old age
 - Only a is true
 - Both a and b are true

36. Metoprolol can be in a heart failure patient except
- patient is diabetic
 - patient is having NYHA-4 symptoms
 - patient is having CKD
 - patient is having hyperlipidemia
 - patient should not be used in a heart failure patient if
 - patient is diabetic
 - patient is having heart rate more than 70/min
 - serum potassium level is more than 5.5 mEq/L
37. Spironolactone should not be used in a heart failure patient if
- patient is diabetic
 - patient is having systolic blood pressure less than 120 mm of Hg
 - age more than 75 Years
 - elevation in leads II, III, aVF.
38. A 48 years old diabetic patient presented with severe central chest pain in emergency. ECG done showing ST elevation in leads II, III, aVF. What is the diagnosis?
- Acute Inferior STEMl
 - NSTEMI
 - Acute Anterior STEMl
 - Acute Posterior STEMl
 - Acute lateral STEMl
39. All of the following investigations are done routinely in patient presented with symptoms of heart failure
- BNP
 - ECG
 - Chest x-ray
 - TSH
 - Echo
40. All of the following are the side effects of Ramipril except
- cough
 - angioedema
 - hyperkalemia
 - bradycardia
 - Hypotension
41. All of the following are the side effects of Metoprolol except
- dizziness
 - aniedema
 - hypotension
 - bradycardia
 - Bronchospasm
 - bronchoconstriction
 - hypertension
 - bradycardia
 - hypotension
 - aniedema
 - dizziness
 - hypotension
 - bradycardia
 - bronchospasm
 - bronchoconstriction
 - hypertension
 - bradycardia
42. All of the following are the causes of chest pain except
- Pulmonary Embolism
 - Pneumothorax
 - Aortic dissection
 - Myocardial infarction
 - done showing ST elevation in leads II, III, aVF. What is the best treatment option?
 - I/V stat piroxicam
 - I/V chloxaparin
 - I/V heparin
 - Angiography followed by PCI
 - Aspirin
43. A 45 years old diabetic patient presented with severe central chest pain for the last 3 hours in emergency. ECG
44. All of the following conditions are the recognized causes of secondary hypertension except
- coarctation of aorta
 - phochromocytoma
 - Diabetes
 - Conn syndrome
 - Hyperthyroidism
45. All of the following are the risk factors of Coronary Artery Disease except
- hyperlipidemia
 - hypertension
 - smoking
 - hypokalemia
 - Diabetes
46. What is the most common complication of nasal foreign body?
- Infection
 - Sinusitis
 - Meningitis
 - Bleeding
 - Nasal septal perforation
47. A 2 years old child playing with toys suddenly developed shortness of breath and decreased air entry. The child already had fever and cough. What is the likely diagnosis?
- Pneumonia
 - Foreign body aspiration
 - Cardiac failure
 - Asthma
 - Pneumothorax

A toddler while playing had a sudden onset of respiratory distress. What is the next step?

- a. Chest X-ray
- b. Bronchoscopy
- c. CBC
- d. Spirometry

59. A young child presented with flu, fever and stridor. He is otherwise active. What is the likely diagnosis?

- a. Epiglottitis

- b. Croup

- c. Foreign body

- d. Asthma

50. A child wakes up at midnight frightened and with barking cough. What is the most likely diagnosis?

- a. Asthma

- b. Pasmodic Croup

- c. Epiglottitis

- d. Night terror

- e. Pharyngitis

51. A child presented with few hours history of high grade fever, toxic look, stridor and drooling of saliva. What will be the first step of management?

- a. Give I/V fluids

- b. Give Paracetamol

- c. Give Antibiotics

- d. Secure airway

- e. Blood culture

52. A child presented with few hours history of high grade fever, toxic look, stridor and drooling of saliva. How will you approach this child?

- a. Throat examination

- b. Chest X-ray

- c. X-ray Neck

- d. CBC

53. A child presented in ER with high grade fever, stridor, drooling of saliva. X-ray Neck showed thumbs sign. What is the most likely diagnosis?

- a. Bacterial tracheitis

- b. Croup

- c. Epiglottitis

- d. Asthma

- e. Laryngitis

54. What is the most common cause of bronchitis?

- a. Parvo Virus

- b. Parainfluenza virus

- c. Influenza Virus

- d. Respiratory Syncytial virus

- e. Adenovirus

- f. Acute respiratory distress syndrome

- g. Pharyngitis

- h. Acute respiratory distress syndrome

55. A 3 month old baby presented with fever, ronchi and rales. Her father had flu few days ago. What is the most likely diagnosis?

- a. Pneumonia

- b. Bronchitis

- c. Bronchiolitis

- d. Adenovirus

56. A 9 month old with cough and cold, having respiratory rate of 40/min. There were no subcostal or intercostal recession on examination. What will be the IMNCI classification?

- a. No Pneumonia

- b. Severe pneumonia

- c. Moderate pneumonia

- d. Sore throat

- e. Some pneumonia

57. A 4 years old child presented with difficulty in breathing, respiratory rate 42/minute and mild subcostal recession. What will do as per IMNCI?

- a. Severe pneumonia, refer to tertiary care hospital

- b. Pneumonia, refer to tertiary care hospital

- c. Pneumonia, give antibiotics and follow after 2 days

- d. Severe pneumonia, give antibiotics and follow after 2 days

- e. Cough & cold, do nothing

- f. Antipilin

- g. Amoxicillin

- h. Co-amoxiclav

- i. Azithromycin

- j. Not recommended

58. A 3 years old presented with cough and mild fever. Her respiratory rate is 18/min without chest indrawing and stridor. Are antibiotics recommended?

- a. Amoxicillin

- b. Co-amoxiclav

- c. Azithromycin

- d. Not recommended

59. What is the treatment of choice for foreign body in airway?

- a. CPR

- b. Bronchoscopy

- c. Endoscopy

- d. Steroids

- e. Antibiotics

60. What is the cause of lobar pneumonia?
- Staph. Aureus
 - Mycoplasma
 - H. influenza
 - Viral pneumonia
 - Mycobacterium tuberculosis
61. What is the most common organism causing pneumonia till 4 years of age?
- Staph. Aureus
 - Mycoplasma
 - H. influenza
 - Pseudomonas
 - Streptococcus pneumonia
62. A child with chronic diarrhea and recurrent respiratory tract infections, has family history suggestive of cystic fibrosis. How will you confirm the diagnosis?
- Chloride test
 - Sweat chloride test
 - Chest X-ray
 - HR CT chest
 - Bronchoscopy
63. In a case of Cystic Fibrosis during sweat chloride testing, what will be the effect on sodium and chloride values?
- Na increases and Cl decreases
 - Na decreases and Cl increases
 - both increase
 - both decrease
 - No set pattern
64. A child presented with recent history of high grade fever, cough and respiratory distress. On examination he was tachypneic with tracheal shift, decreased air entry on one side of chest and dull percussion note. Likely diagnosis?
- Tuberculous pleural effusion
 - Bacterial pneumonia
 - Inflammatory thorax
 - Foreign body aspiration
65. A child developed empyema. What is the most common organism responsible for empyema?
- Tuberculosis
 - Staph. Aureus
 - Streptococcus pneumoniae
 - Chlamydia
 - HSV
66. What is the most common congenital heart defect with a left to right shunt causing congestive heart failure in the pediatric age group?
- Patent ductus arteriosus
 - Patent foramen ovale
 - Atroventricular canal defect
 - Ventricular septal defect
 - Aortoconfluent window
67. A 2-year-old infant is noted to have mild cyanosis who assumes a squatting position during long walking. He is noted to have increasing fussiness followed by increasing cyanosis, limpness, and unresponsiveness. The most likely underlying lesion is
- Hypoplastic left heart
 - stenosis of falot
 - transposition of great vessels
 - Aspiration of air passages
 - Automalous pulmonary venous return
68. What is the most common complication of infective endocarditis?
- CONGESTIVE HEART FAILURE
 - PERICARDIAL EFUSION
 - SPLEENOMEGALY
 - CEREBRAL STROKE
 - HEMATOMA
69. Which of the following would not be an expected sign of right-sided congestive heart failure?
- Prominent jugular vein
 - Pulmonary edema
 - Leptonychia
 - Right ventricular hypertrophy
70. Which of the following infection is commonly associated with Rheumatic fever?
- Group B Streptococcus lower respiratory tract infection.
 - Group A Streptococcus upper respiratory tract infection
 - Streptococcus pneumoniae upper respiratory infection
 - Adenovirus lower respiratory tract infection
 - Staphylococcus aureus upper respiratory tract infection
71. All of the following are major criteria on the Jones Criteria for Rheumatic Fever EXCEPT which one?
- ERYTHEMA MARGINATUM
 - CHOREA
 - SUBCUTANEOUS NODULES
 - FEVER
 - POLYARTHRITIS

what types of medications are used to treat and manage rheumatic heart disease?

- a. Throat examination
- b. Chest X-ray
- c. X-ray Neck
- d. CBC

73. What happens in rheumatic fever?

- a. There is no immune response.
- b. The immune system attacks only the bacteria, resulting in an illness.
- c. A AND B
- d. There is an unreactive immune body protein.

74. Which of the following is the primary site of infection in infective endocarditis?

- a. Myocardium
- b. Pericardium
- c. Epicardium
- d. Endocardium

75. Which of the following microorganisms is commonly associated with acute, rapidly progressing endocarditis?

- a. Streptococcus viridans
- b. Staphylococcus aureus
- c. Enterococcus faecalis
- d. Streptococcus bovis

76. Janeway lesions, Osler's nodes, and Roth spots are clinical signs associated with:

- a. INFECTIVE ENDOCARDITIS
- b. ATHEROSCLEROSIS
- c. MYOCARDITIS
- d. PERICARDITIS

77. The condition associated with the highest risk of developing infective endocarditis (IE) is:

- a. Mitral valve prolapse with regurgitation.
- b. The presence of a prosthetic heart valve.
- c. Rheumatic fever without valvular defects.
- d. Intravenous drug abuse.

78. All true regarding ASD Except:

- a. Atrial septal defect is the second most common congenital heart defect in children and adults.
- b. Patients with atrial septal defects may have an embolic stroke as the initial presentation.
- c. Most children with atrial septal defects are asymptomatic.
- d. The most common yet least serious type of atrial septal defect is ostium secundum defect.

79. Tetralogy of Fallot is defined by which of the following lists of defects?

- a. Ventricular Septal Defect, Aortic Stenosis, Overriding aorta, Left Ventricular Hypertrophy
- b. NONE OF THESE
- c. Atrial Septal Defect, Pulmonic Stenosis, Over-riding aorta, Right Ventricular Hypertrophy
- d. Ventricular Septal Defect, Pulmonic Stenosis, Over-riding aorta, Aortic Stenosis

80. Most common ASD is:

- a. Ostium secundum
- b. Ostium primum
- c. Sinus venosus
- d. All of the above

81. Murmur heard in ASD:

- a. Soft murmur
- b. Mid diastolic murmur
- c. Best heard at upper left sternal border
- d. Wide and fixed splitting of S2

82. PDA can cause all of the following EXCEPT:

- a. LEFT VENTRICULAR OVERLOAD
- b. CONGESTIVE HEART FAILURE
- c. ALL OF THE ABOVE
- d. NONE OF THE ABOVE

83. As the doctor you know which statements below are correct about the ductus arteriosus?

- a. The ductus arteriosus is a structure that should be present in all babies "in utero."
- b. The ductus arteriosus normally closes about 3 days after birth or sooner.
- c. The purpose of the ductus arteriosus is to help carry blood that is entering the left side of the heart to the rest of the body, hence bypassing the lungs.
- d. The ductus arteriosus connects the aorta to the pulmonary vein.
- e. Both A and B

84. Which 1 of the following is cyanotic heart disease?

- a. Patent ductus arteriosus
- b. Ventricular septal defect
- c. ToF
- d. Atrial septal defect

e. None of the above

85. What is the most common cause of bronchiolitis in infants?

- a. Influenza virus
- b. Adenovirus
- c. RSV
- d. Respiratory syncytial virus

86. A 60-year-old male presents to you in OPD with progressively increased breathlessness for the last few months. At so he has cough productive of white-colored sputum. He smokes 10-20 cigarettes per day. On examination he is mildly tachypneic at rest. Chest examination revealed prolonged expiration with occasional white, how will you assess the severity of symptoms? Select one

- a. Chest x-ray
- b. CT chest
- c. Measuring FEV₁/VC ratio
- d. Measuring Arterial blood gases

87. A 40 year male presented to emergency room with the history of Right sided chest pain, cough, fever and breathlessness for the last 2 days. On examination he is ill looking, tachypneic. His temperature is 100°. He has situs inversus. He is haemodynamically stable. Chest examination revealed poor expansion and fever for the last 3 days. On examination he is draway but trousseau, has rapping tremors of the fingers. Chest examination revealed bilateral basal lung fields. His echo was normal. What is the likely diagnosis? choose one

- a. R-sided pneumonia
- b. Sarcoid
- c. Atrial fibrillation
- d. Pneumothorax

88. A 60-year-old male who is smoker for many years ad has been getting progressively worsening breathlessness for many months came to emergency room with increased breathlessness, cough, sputum and fever for the last 3 days. On examination he is draway but trousseau, has rapping tremors of the fingers. Chest examination revealed bilateral basal lung fields. His echo was normal. What is the likely diagnosis?

- a. Chronic obstructive pulmonary disease
- b. Humoural pedofecting disease
- c. Acute bronchitis
- d. Idiopathic pulmonary fibrosis

89. A 60 year male who is ex-smoker, who quit smoking a year ago after having smoked for 30 years and has no other co morbidity, presented to OPD with the history of exertional dyspnoea, dry cough for the last few months. There SP_{o2} is 90% at rest. He has developed hoarseness of voice and difficulty in swallowing solids. He has lost weight. On examination he is cachectic, ill looking and dyspnæic at rest. He has clubbing fingers. Chest examination revealed that the trachea has shifted to the right on the chest. He had poor expansion of the chest on the L side with impaired percussion and diminished breath sounds on the L chest. X-ray showed that the trachea is shifted to the L and there was an opacity on the L upper zone. What is the likely diagnosis? Select one

- a. L-sided pneumonia
- b. COVID-19
- c. COPD with acute exacerbation
- d. R-sided pneumonia

90. A 70-year male presented to Emergency room with the history of breathlessness on mild exertion for the last few months. Also, he complained of cough productive of sputum and nonproductive hemoptysis. He has developed hoarseness of voice and difficulty in swallowing solids. He has lost weight. On examination he is cachectic, ill looking and dyspnæic at rest. He has clubbing fingers. Chest examination revealed that the trachea has shifted to the right on the chest. He had poor expansion of the chest on the L side with impaired percussion and diminished breath sounds on the L chest. X-ray showed that the trachea is shifted to the L and there was an opacity on the L upper zone. What is the likely diagnosis? Select one

- a. L-sided pneumonia
- b. COVID-19
- c. COPD with acute exacerbation
- d. R-sided pneumonia

91. A 40 year old lady presented to the emergency department with the history of cough productive of purulent sputum, hemoptysis. L sided chest pain and breathlessness for the last two days. She has no comorbidity and non-smoker. On examination she is ill looking, breathless and her respiratory rate was 30/minute. Her oxygen saturation was 80% on pulse oximetry. She was confused and restless. The chest examination revealed diminished movement of the chest on the R side, with impaired percussion note and bronchial breath sounds. Chest x-ray showed patchy opacity on the L lower zone. What is usual causative organism of this condition?

- a. Mycoblasma pneumoniae
- b. Mycobacterium tuberculosis
- c. Streptococci pneumoniae
- d. Klebsiella pneumoniae

92. A 70 years female came to emergency room with the history of fever, cough, sputum, R sided chest pain and breathlessness for the last 3 days. Also, she complained about anorexia. On examination she looked ill with coated tongue, herpes labialis. BP was 80/60 and pulse pyrexial. She was breathless and her respiratory rate was 30/minute. Her oxygen saturation was 80% on pulse oximetry. She was confused and restless. The chest examination revealed diminished movement of the chest on the R side, with impaired percussion note and bronchial breath sounds. Chest x-ray showed R sided consolidation. Her blood investigations revealed leukocytosis with urea of 11mmol/l. Where should this patient be managed? Select one.

- a. Can be discharged home with antibiotics
- b. Should be admitted in hospital and managed in the ward
- c. Should be admitted to ICU in hospital
- d. Should be observed in ER for 24 hours
- e. Should be referred to chest specialist in OPD.

4. Which is the most common lung tumor in non-smokers?
- Adenocarcinoma
 - Squamous cell carcinoma
 - Small cell carcinoma
 - Large cell carcinoma
 - Carcinoid tumor

94. Which lung tumor is most chemo-sensitive?

- Squamous cell carcinoma
- Large cell carcinoma
- Small cell carcinoma
- Hamartoma
- Bronchialavicular carcinoma

95. A 65 Years old smoker with 30 pack-year histories presented to the emergency department with shortness of breath and haemoptysis. He presumed the haemoptysis to be 600 ml in the last 24 hours. CT scan of the chest shows a mass in the left lower lobe. Keeping in mind the scenario which statement is correct?

- Pulmonary arterial circulation is at high pressure low capillary circulation
- Bronchial circulation is at high pressure high capillary circulation
- Bronchial circulation constitutes 98 % of lung circulation
- Bronchial circulation is responsible for haemoptysis in this case
- Bronchiectasis is less common cause of massive haemoptysis

96. In COPD patients with Alpha-1 antitrypsin deficiency (AATD), which mechanism is the basis for AATD pathology?

- Increased bacterial colonization of lung tissue
- Unbalanced neutrophil elastase activity in lung tissues
- Reduced recruitment of white blood cells to lung tissues
- Enhanced cytokine production by AAT-deficient white blood cells
- Increased hydrogen peroxide activity in lung tissue

97. A young male presented to you with dry cough and central chest pain from the last one month. You ordered an X-ray chest that showed bilateral hilar lymphadenopathy. You suspect sarcoids. What else in blood tests of this patient can be found to strengthen your suspicion?

- Low calcium
- Raised ACE level
- Raised hemoglobin
- High ESR

98. Which of the following statement is correct regarding COPD?

- 15% of patients are non-smoker
- Biomass burn exposure is not the causes of COPD
- 10 pack years smoking history is strong predictor
- Hemoptysis is common in COPD and needs not to be investigated
- Blue blisters are common in emphysema

99. Pulmonary hypertension is called primary pulmonary hypertension when it's caused by

- Cardiac disease
- Hypoxemia secondary to COPD
- Idiopathic pulmonary embolism
- Granulomatous disease like sarcoidosis⁵, shortness of breath and cough from the last 6 months. On examination he is clubbed, his saturation is 93% and there are bilateral crepitations. His x-ray's show naevus in the lower zones. There is no other systemic disease. What can be investigation of choice in this case?

100. A 70-year-old ex-smoker presented with shortness of breath and there are bilateral crepitations. His x-ray's show naevus in the lower zones with contrast

- CT thorax
- HRCT thorax
- Bronchoscopy
- Bronchoscopy

101. A young female presented with exertional dyspnoea. Her chest examination and sputrometry are normal and echocardiography shows very high ventricular systolic pressure. She underwent right heart catheterization and is diagnosed with primary pulmonary hypertension. Which of the following medication is not used to treat pulmonary hypertension?

- Calcium channel blocker
- Endothelin receptor antagonist
- Digoxin
- Prostacyclin

102. Cigarette smoking is most common risk factor for development of COPD. Its dose is commonly calculated in pack year. What minimum dose of smoking is considered risk factor for COPD development?

- 5 pack/year
- 10 pack/year
- 15 pack/year
- 20 pack/year
- 25 pack/year

103. A 50-year-old smoker comes to see you because he has had a cough for the last eight weeks and his weight has fallen by 5 kg. He is concerned as he notices streaks of blood in his sputum. Recently what is the most likely appropriate initial investigation?

- Sputum AFB
- Bronchoscopy
- Spirometry
- HRCT chest
- Chest X-ray

104.

A 28 years old man presents with a six-week history of a hoarse voice, weight loss, and malaise. He also has night sweats. What is the most likely diagnosis?

- a. Acute laryngitis
- b. Laryngeal tuberculosis
- c. Primary tuberculosis
- d. Laryngeal polyp
- e. Hypothyroidism

105. A 45 years chronic smoker presents to your clinic with cough, hemoptysis and shortness of breath for the last 3 months. His chest X-ray shows what is the most likely diagnosis?

- a. Lobar pneumonia
- b. Pulmonary edema
- c. Bronchogenic carcinoma
- d. Alveolar pneumonia
- e. Pulmonary fibrosis

106. 26-year-old woman with epilepsy has been diagnosed with pulmonary Tuberculosis and is about to be started on quadruple therapy. The following need to be discussed with her except:

- a. Mastoid of contraception
- b. The need for screening for ocular complication with ethambutol
- c. Interaction with other medications
- d. Discoloration of urine due to isoniazid

107. 19-year-old man with 30 pack year cigarette smoking history has been poorly adherent to his treatment. IBS is recurred.

Previously, Her chest radiograph was unchanged from one take at this time. Which of the following is the most likely explanation for the finding?

- a. She has HIV co infection causing increased susceptibility to mycobacteria
- b. The organism isolated on sputum is resistant to isoniazid
- c. She has become infected with a different strain of TB
- d. She has underlying IFN-G receptor deficiency causing increased susceptibility to mycobacteria

108. A 75-year-old man with a small right pupil and right-sided ptosis. On examination you note previously persistent cough and weight loss. His chest radiograph shows a peripheral infiltrate on the left side. His CRP is elevated. His CXR shows hyper inflated lung fields with flat diaphragms. What is the underlying lung pathology?

- a. Small cell lung cancer
- b. Squamous cell carcinoma
- c. Bronchogenic carcinoma of lung
- d. Asthma
- e. Interstitial pneumo of left lung
- f. Sarcoidosis
- g. Chronic heart failure
- h. Pulmonary hypertension
- i. Chronic obstructive airways disease

110. A 75-year-old male presented to the emergency department with severe shortness of breath. His respiratory rate is more than 30, his saturations are 80% on room air. He is unable to complete sentences. He suddenly collapses. There are no relatives available for getting a collateral history. On examination, he has tar stained nails. His CXR shows hyper inflated lung fields with flat diaphragms. What is the underlying lung pathology?

- a. Atopic asthma
- b. Chronic heart failure
- c. Sarcoidosis
- d. Pulmonary hypertension
- e. Chronic obstructive airways disease

111. A 25-year-old girl with severe difficulty in breathing presents to the emergency room with a week history of dyspnoea, fever, cough and white cell count, urea and creatinine levels were raised. What is the diagnosis?

- a. Infective exacerbation of COPD
- b. Infective endocarditis
- c. Acute kidney injury
- d. Community acquired pneumonia
- e. Bronchogenic carcinoma

112. A 54-year-old man with history of Myocardial Infarction 2 years ago attends the Pulmonology clinic with the chief complaints of cough, shortness of breath and orthopnoea. Chest X-ray was done which revealed bilateral pleural effusion. Pleural fluid analysis was performed which revealed a transudate. What is the cause of his effusion?

- a. Simple Pneumonic Effusion
- b. Complicated para-pneumonic Effusion
- c. Lung Malfunction
- d. Pulmonary thromboembolism
- e. Congestive cardiac failure

113.

- A 18 years old boy presented to emergency dept. with the history of left sided chest dullness. Chest examination he is tall and thin. He is hemodynamically stable. He is anxious and breathless since last two days. She has diabetes and hypertension. On Auscultation there was normal vesicular breathing. Left side Pneumothorax

114.

- A 60 years old lady who is confined to bed for the last one year because of left-sided weakness, developed chest pain, breathlessness and blood mixed sputum for the last two days. She has diabetes and hypertension. On examination she was tachypneic and tachycardic. On Chest Auscultation there was normal vesicular breathing. What could be the most likely Diagnosis?

- a. Pneumonia
b. Myocarditis
c. Pulmonary Embolism
d. Right side Pneumothorax

115.

- A 20-years-old student residing at a religious institute presents with Cough, Haemoptysis and weight loss. Chest X-ray reveals cavitating lesions in the right upper zones. What would be your next investigation of choice?

- a. CT Chest with contrast
b. BAL for cytology
c. Sputum for fungal hyphae
d. Sputum for Ziehl Neelsen staining

116.

- A 24 years old man is brought into the emergency department after a fall from a ladder. His breathing is labored and he is cyanotic. No breath sound can be heard, even in the right lung field, which is resonant to percusion. The first step in his management should be

- a. Cricothyroidotomy
b. Obtaining a stat chest X-ray
c. Passing an oral endotracheal tube
d. Starting oxygen by a valve-mask device

117.

- The optimal method for managing a patient with a massive flail chest is

- a. Controlled breathing with a valve-mask device delivering pure oxygen
b. Elevation of the flail segment with skeletal traction
c. Endotracheal intubation and mechanical ventilation
d. Intercostal nerve blocks and nasal oxygen
e. Stabilization of the flail segment with sandbags

118.

- A 65 year old man undergoes cardiac surgery for triple vessel coronary artery disease. What can he anticipate?

- a. 95% chance his grafts will occlude after 12 months.
b. 5% chance of living for 5 years.
c. If the internal mammary artery is used as a conduit, patency is increased.
d. Mortality of 10-20% in most centers.

119.

- While landing at the end of flight a young woman develops shortness of breath and right sided pressure chest pain. She is tall and thin. The pain, although less in intensity, occurs during her menstrual periods. She has not previously consulted a doctor. A chest film is likely to show?

- a. Left pleura effusion
b. Pneumothorax
c. Dilated stomach
d. Widening of the mediastinum

120.

- A patient with a moderate sized aneurysm of the descending thoracic aorta is likely to have:

- a. Back pain
b. diaphragmatic paralysis
c. Recurrent nerve palsy
d. Tracheal compression
e. No symptoms
