Khyber Girls Medical College

polydipsia for the past 1 month. On examination examination GCS 10/15, acidotic breathing, urine re ketones 3+, RBS 375mg/dl. What is the most likely diagnosis?

a. Diabetic ketoacidosis

- b. Hyperosmolar non ketotic coma
- c. Urinary tract infection

- 118. A 8 year old child presented to you with failure to thrive, darkening of mucous membranes and recurrent episodes of dehydration. Labs show Sodium 120 meq/l, potassium 6 meq/l, RBS 40mg/dl, Raised ACTH and low cortisol. What is the most likely diagnosis?
 - a. Addison's disease
 - b. Diabetes Mellitus
 - c. Hypothyroidism
 - d. Hyperthyroidism
 - e. Hypoparathyroidism
- 119. A 9 year old child presents to you with 1 year history of heat intolerance, diarrhoea examination and weight loss. On exophthalmos, fine tremors, sweaty palms. Labs show low TSH and raised T3 and T4. What is the most likely diagnosis?
 - a. Hypothyroidism b. Hyperthyroidism
 - c. Addison's
 - d. Diabetes mellitus
 - e. Celiac disease
- 120.Bacterial pneumonia is more common in Pakistan and is considered the most common cause of death in children less than five year old. The most common bacteria isolated from acute lower respiratory infections/in children include:
 - (a) Streptococcus pneumonia, Haemophilus influenzae, Staphylococcus aureus and Group A.Streptococci
 - b. Streptococcus pneumonia, Haemophilus influenzae, Staphylococcus aureus and Group B.Streptococci
 - c. Streptococcus pneumonia, Haemophilus influenzae, Staphylococcus aureus and Staphylococcus epidermidis
 - d. Streptococcus pneumonia, Haemophilus influenzae, Staphylococcus aureus and Klebsiella pneumonia
 - e. Streptococcus pneumonia, Haemophilus influenzae, Staphylococcus aureus and Mycobacterium tuberculosis

- d. Postmature pregnancy.
- e. All of the above.
- es, infants of diabetic mothers are at risk of one of the following:
 - a. Low Hb.
 - b. Hypercalcemia.
 - c. Hyperglycemia.
 - d. Microsomia.
 - (e) Respiratory distress syndrome

92. Risk Factors for DVT include all, EXCEPT:

- a. Smoking
- b. Operative delivery
- c. Lupus anticoagulation
- d. Maternal weight over 80 kg
- (e) Hyperthyroidism

93. The period of gestation on dating scan is calculated by measuring:

- (a) Crown rump length
- b. Biparietal diameter
- c. Femur length
- d. Head circumference
- e. Abdominal Circumference

94.Regarding biophysical profile which one is not assessed on ultrasound

- (a. Non stress test
- b. Amniotic fluid volume
- c. Fetal breathing movements
- d. Fetal body movements

95. Which of the following is a normal cardiovascular change during pregnancy?

- a. Decreased cardiac output
- b. Increased systemic vascular resistance
- c. Decreased heart rate
- (d.) Increased blood volume
- e. increased blood pressure
- 96. A newborn is noted to have a darkened swelling of the scalp that does notcross the midline. This is most likely a:
 - a. Caput succedaneum. > COSS
 - b. Subdural hemorrhage.
 - C Cephalohematoma.
 - d. Subarachnoid hemorrhage.
 - e. Tentorial tear

97. Advantage of lower segment caesarean section over the classic incision includes:

- a. Ease of repair
- b. Decreases blood loss
- c. Lower probability of subsequent uterine rupture
- d. Decreases danger of intestinal obstruction
- (Fe All of the above

98. All of the following causes Oligohydramnios EXCEPT:

- a. Renal agenesis
- b. Poor placental perfusion
- c. Post term pregnancy
- Anancenhaly

- e. Urinary obstruction
- 99. Which of the following causes of polyhydramnios is most common:
 - a. Twin pregnancy.
 - b. Diabetes.
 - c. Hydrops fetalis.
 - d. Anencephaly.
 - (e.)Idiopathic.

100. The most common cause of perinatal death in mono-amniotic twin is:

- @ Cord entrapment.
- b. Cord prolapse.
- c. Twin-twin transfusion syndrome.
- d. Lethal congenital anomalies.
- e. Placental abruption
- 101. A pregnant woman presents with a placenta previa of a major degree and fetus is malformed. Which of the following will be the best management?
 - a. Caesarian section Assol
 - b. Oxytocin drip
 - c. Rupture of membranes
 - d. Induce with PG E2
 - e. Forceps delivery in the second stage to accelerate delivery.

102. Anti-D prophylaxis:

- a. Should be given to all sensitized Rhesus negative women after delivery
- b. Should be given to all Rhesus positive women after amniocentesis.
- (c.)Should be given to all Rhesus negative women who give birth to Rhesus positive babies.
- d. Should be given to all women whose babies are Rhesus negative
- e. Is contra-indicated during pregnancy if the woman is Rhesus negative

103. Postpartum hemorrhage can occur due to all the followings EXCEPT:

- a. Fetal macrosomia.
- b. Polyhydramnios.
- c. Placenta previa.
- d. Abruptio placenta.
- e. Postdate pregnancy.
- 104. Advantage of lower segment caesarean section over the classic incision includes:
 - a. Ease of repair
 - b. Decreases blood loss
 - c. Lower probability of subsequent uterine rupture
 - d. Decreases chance of gut injury
 - (All of the above

105. A newborn is noted to have a darkened swelling of the scalp that does not cross the midline. This is most likely a:

- a. Caput succedaneum.
- b. Subdural hemorrhage.
- C Cephalohematoma.

 - d. Subarachnoid hemorrhage

e. Tentorial tear. 106. All the following are possible causes of premature labour, EXCEPT:

a. Multiple pregnancy

b. Polyhydramnios Bicornuate uterus

Anencephaly

Perinatal infection

107. Which of the following is NOT considered a

a. Gestational diabetes

b. Cardiac disease in pregnancy © Candida infection in pregnancy

Bleeding in pregnancy

e. Patient with history of previous IUFD 108. The following are causes for a uterus that is large for gestation during pregnancy,

Multiple pregnancy

(6) IUGR

c. Fibroid

d. Polyhydramnios

e. Incorrect dating of pregnancy 109. A 30 year old woman comes to the OPD with art neck lump for the last two months and she denies any associated symptoms like palpitations, hot flushes examination etc. the lump swallowing but not on tongue protrusion. The lump is 2 cm, soft, with smooth surface. There is no evidence of lymphadenopathy. Her FNAC shows important step?

a. Incision biopsy > avoided may cause seed ting.

b. Total thyroidectomy afterestat adenoma Diagnostic Rt lobectomy - FNAC connel from carcinera d. Trucut biopsy-

e. Radioiodine

110. Which of the following laboratory test will effectively exclude or confirm hyperthyroidism in a 25 year old lady with a nodular goiter.

(a) Thyroid stimulating harmone

b. Serum total T4 level

c. Thyroid binding globulin

d. Serum T3 level

e. Serum iodine level

111, With regard to PTH, which of the following statements is incorrect?

(a) PTH blocks calcium excretion at the ascending limb of the loop of Henle.

b. PTH stimulates osteoclast resorption of calcium and phosphate?

c. PTH cells express G protein-coupled calcium-sensing receptors

d. PTH inhibits calcium excretion at the distal convoluted tubule of the kidney.

e. PTH enhances renally mediated hydroxylation of 25-hydroxyvitamin D.Y

gital anomalies esophageal fist nchiectasi eart failu

112. All of the following are consistent with hyperparathyroldism except: History of chronic kidney disease (CKD)/chronic renal insufficiency (CRI)

Elevated serum calcium level

Vitamin D deficiency

113. A 60 years male underwent total thyroidectomy for MNG. The patient by poratty ord displaced carpopedal spasm in the evening. Treatment will be

IV bicarbonate IV potassium

IV calcium gluconate IV para tharmone 0

114. A 30 years old woman comes to OPD with a 04 month history of lump in the neck. On examination it moves on swallowing but not when she protrudes her tongue, what is the most likely diagnosis?

Thyroglossal cyst

Laryngocele

Lymph node Thyroid nodule **(a)**

Brancheal cyst

115. A 57-year-old woman is noted to have a 1.5-cm breast mass, which on tru-cut needle biopsy is diagnosed as invasive carcinoma. The surgeon is planning on a local tumor resection and sentinel lymph node assessment. Which of the following most accurately describes a sentinel lymph node?

A lymph node containing cancer a. metastases

The lymph node that is most likely to become infected postoperatively

The first lymph node in the lymph node basin draining a tumor

The only lymph node that contains metastasis

The surgical margins of an axillary dissection

116. A 14 year old girl has a firm movable and rubbery mass in her Lt Breast. The mass was first noticed 6 months ago and has since grown to about 6cm in diameter. Which of the following is most likely

Cystosarcomaphyllodes

Cancer of breast b.

Giant juvenile fibroadenoma

Intraductal papilloma

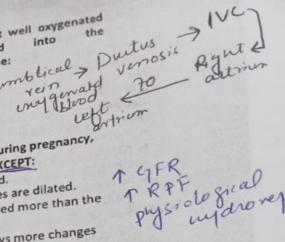

Fibrocystic disease of breast

117. A 7 year old boy presented with history of unconsciousness since this morning, there is also history of polyuria and

Block p Paper 2024 Girls Medical College The uterine fundus should not be palpable abdominally by 14 days after a. Diagnosed only when the cervix is fully d. The incidence of postpartum depression b. Usually predicted before the onset of e. Fever due to engorged breast occurs on More common in developed countries. d) Mento-posterior position could be a modefic A4. Risk factors of postpartum Endometritis the second day after delivery include all of the following, EXCEPT: e. X-ray pelvimetry is essential to predict cephalo pelvic disproportion in b. Prolonged rupture of membranes 78.Which contraindication to a trial of labor after 0.F c. Multiple vaginal exams d. Prolonged monitoring with an intrauterine pressure catheter (a) Prior classical incision. puerperal b. Prior cesarean delivery for dystocia. (e) Gestational diabetes and signs c. Prior IUFD. d. Ultrasound estimation of fetal weight 85.Symptoms include endometritis a. Malodorous vaginal discharge. following, EXCEPT: e. Prior cesarean delivery for breech 79. Prolapse of umbilical cord: Which is true? b. Lower abdominal pain. a. Not an indication for caesarean section Dinvolution of the uterus. when baby viable at 36 weeks e. Uterine tenderness on palpation. 86.In the mother suckling leads to which of b. Diagnosed when membranes are still the following responses? c)s more common when fetus acquires b. Increase of prolactin-inhibiting factor an abnormal lie Increase of hypothalamic dopamine d. Incidence is 5% e. Causes severe respiratory alkalosis (Increase of hypothalamic Prolactin. 80. The following are absolute Indication for Ce. Increase of luteinizing hormonesection EXCEPT: releasing factor (a) Face presentation. 87. All the following methods inhibit lactation b. Shoulder presentation. c. Cervical cancer. a. Restriction of fluid and diuretics d. Fibroids in the lower uterine segment. b. Tight breast binder and analgesics e. Previous classical C-section. estrogen hormone in large dose 81. Complete breech means: (d) Thyroxin hormone a. Flexion at hip joint and extension in e. Dopamine agonist knee joint- framk 88. In eclampsia: Which is true? (b) Flexion at hip joint and flexion at knee a. Caesarean section must be carried out in all cases c. Extension at the hip joint b. Hypotensive drugs should not be used d. Flexion at knee joint and extension at c. Urinary output is increased the hip joint d. Antidiuretic drugs are essential in all e. Flexion of one leg at hip joint and extension of the other leg at the hip (E) Ergometrine should be avoided in the Joint 82. An infant present as a breech presentation third stage of labor and delivered without assistance as far as 89 Risk factors for pre-eclampsia include all the umbilicus. The reminder of the body is of the following, EXCEPT: manually assisted by the obstetrician. This a. Elderly primigravida b. African ethnicity is called: c. Positive family history of hypertension Version and extraction d. Positive history of pre- eclampsia in Spontaneous breech delivery c. Assisted breech delivery - operative d. Total breech extraction trasps Extract previous pregnancies e. Positive history of macrosomic baby Drabdes Hx 90 Maternal complications associated with e. Pipers of the after-coming head polyhydramnios include: 83. Regarding Puerperium: Weeks a. High blood pressure. a. Refer to the first 6 months after b. Urinary tract anomalies. any where c. b. The lochia usually persists for 7 weeks Diabetes. May be

- e. Respiratory acidosis
- 48.A 60-year-old man with type 2 diabetes presents for routine follow-up. His blood pressure is 145/92 mmHg, and laboratory tests show microalbuminuria.) What is the next best step in his management?
 - a. Start an SGLT2 inhibitor
 - Initiate insulin therapy
 - Prescribe an ACE inhibitor or ARB
 - d. Increase dietary protein intake
 - e. Repeat the microalbuminuria test in 6 months
- 49.A 35-year-old pregnant woman is diagnosed with gestational diabetes at 28 weeks of gestation. What is the first-line treatment for glycemic control in this condition?
 - a. Metformin
 - b. Sulfonylurea
 - Diet and exercise 1st line
 - d. Insulin
 - e. GLP-1 receptor agonist
- 50.A 60-year-old man with type 2 diabetes presents with burning and tingling in his feet, consistent with peripheral neuropathy. Which medication is most appropriate to manage his symptoms?
 - . Metformin
 - (b.) Pregabalin
 - c. Insulin
 - d. DPP-4 inhibitor
 - e. SGLT2 inhibitor
- 51.A 72-year-old man with type 2 diabetes is on basal insulin and experiences frequent nocturnal hypoglycemia. What adjustment is most appropriate to prevent hypoglycemia?
 - a. Increase the basal insulin dose
 - b. Add a GLP-1 receptor agonist
 - c. Switch to a shorter-acting insulin
 - (d.) Decrease the basal insulin dose
 - e. Stop all insulin therapy
- 52.A 32-year-old man with obesity and a family history of diabetes undergoes screening. His HbA1c is 6.4%. What is the most likely interpretation of this result?
 - a. Normal glucose metabolism
 - (b.) Prediabetes
 - c. Type 1 diabetes mellitus
 - d. Type 2 diabetes mellitus
 - e. Latent autoimmune diabetes in adults
- 53.Lowered Hemoglobin during normal pregnancy is a physiological finding. It's mainly due to:
 - a. low iron stores in all women.
 - b. Blood loss to the placenta
 - (c) Increased plasma volume.
 - d. Increased cardiac output resulting in greater red cell destruction.
 - e. Decreased reticulocytosis
 - 54. The following are presumptive skin signs of pregnancy except:

- 6) Maculo-papular rash
- c. Linea Nigra
- d. Stretch Marks
- 55. After birth, all of the following vessels
- constrict EXCEPT:
 - a. Ductus arteriosus.
 - b. Umbilical arteries.
 - Ductus venosus.
- d Hepatic portal vein.
- 56. In the fetus, the most well oxygenated
 - systemiccirculation by the: blood
 - a. Ductus arteriosus. 6. Foramen ovale.
 - c. Rt. Ventricle. d. Ligamentum teres.
 - e. Ligamentum venosum
- 57. Regarding renal tract during pregnancy,
- the following are true EXCEPT:
- a. The ureters are dilated.
- b. The renal pelvis calyces are dilated.
- b. The renal pelvis calyces are than the
- crossing that left side.
- & overion vesseld. The primigravida shows more changes
 - e The bladder tone increases.
 - 58. All the following are possible causes of Polyhydramnios, EXCEPT:
 - a. Diabetes
 - b. Multiple pregnancy
 - c. Fetus with hydrops fetalis
 - d. Fetus with duodenal atresia or neural tube defect
 - (e) IUGR
 - 59. All of the following causes Oligohydramnios EXCEPT:
 - a. Renal agenesis
 - b. Poor placental perfusion
 - c. Post term pregnancy
 - (a) Anencephaly
 - e. Urinary obstruction
 - 60. Which one of the following is caused in fetus due to deficiency of folate
 - a. Dextrocardia
 - (b) Neural tube defects
 - c. Gastroschisis
 - d. Cleft palate
 - e. Urinary obstruction
 - 61.Components of biophysical profile include all of the following, EXCEPT:
 - a. Fetal movement
 - (6) Placental thickness
 - c. Fetal tone
 - d. Fetal breathing movement
 - e. Amniotic fluid volume assessment 62.Antenatal fetal monitoring can NOT be

- b. Proximal Renal Tubular Acidosis
- Bartter Syndrome
- Distal Renal Tubular Acidosis
- (c) Nephrogenic Diabetes Insipidus
- 38.An 8 year old pale looking girl presents with short stature having polyuria and serum creatinine of 8mg/dl.Most probable diagnosis of a patient presenting with such complaints is?
 - a. Renal tubular acidosis
 - Nephrotic syndrome
 - Cochronic renal failure
 - d. Acute renal failure
 - e. IGA nephropathy
- 39. Urine dipstick testing of a specimen obtained from a febrile 4 yr old child with acute viral gastroenteritis shows specific

gravity 1.030, pH 5.0,12+ proteinuria, and no blood cells. The most likely cause of the a Transient proteinuria - After (1.005 -1.030

patient's proteinuria is:

- b. Nephrotic syndrome
- c. Orthostatic proteinuria
- d. Acute glomerulonephritis
- e. Acute kidney injury
- 40.A 04 years old healthy girl has a urinalysis as part of her well child visit. Urine dipstick testing shows specific gravity 1.014, pH 6.0, and 2+ proteinuria and is negative for blood. Microscopic examination of the urine is unrevealing. The most appropriate next step in diagnosis is to:
 - (a) Collect a 24-hr urine specimen for measurement of protein and creatinine;
 - b. Draw blood for a serum chemistry panel;
 - c. Measure serum complement levels (C3,
 - d. Perform urine dipstick testing on a 1st morning-voided sample;
 - e. Measure the urine protein to creatinine
- 41.A 45-year-old woman presents with increased thirst, frequent urination, and unexplained weight loss. Blood tests reveal fasting plasma glucose of 180 mg/dL and HbA1c of 8.2%. Which mechanism primarily contributes to the patient's hyperglycemia?
 - a. Increased insuli sensitivity in peripheral tissues
- (b) Enhanced hepatic gluconeogenesis
- c. Reduced renal glucose reabsorption
- d. Suppression of glucagon secretion
- e. Excessive insulin degradation
- 42.A 50-year-old man with obesity and hypertension presents for evaluation. His fasting plasma glucose is 126 mg/dL, and his HbA1c is 6.6%. He 2126

reports no symptoms of hyperglycemia. What is the most likely diagnosis?

- a. Prediabetes
- b. Type 1 diabetes mellitus
- Type 2 diabetes mellitus
- d. Latent autoimmune diabetes in adults
- e. Gestational diabetes mellitus
- 43.A 35-year-old man is evaluated for diabetes due to a family history and obesity. His fasting glucose is 105 mg/dL, and his 2hour postprandial glucose is 165 mg/dL. What is the most appropriate diagnostic classification?

a. Normal glucose tolerance

- b. Prediabetes
- c. Type 1 diabetes mellitus
- d. Type 2 diabetes mellitus
- e. Gestational diabetes mellitus

44.A 65-year-old man presents for an annual checkup. He has no symptoms, but his fasting plasma glucose is 130 mg/dL on >/106 two separate occasions. Which additional test is most useful to confirm the diagnosis b. 2-hour oral glucose tolerance test > 97 Fgs different
c. Random plasma glucose measurement of diabetes in this patient?

(a) HbA1c measurement

- d. Serum fructosamine level
- e. C-peptide level
- 45.A 55-year-old patient with type 2 diabetes and chronic kidney disease has an eGFR of 25 mL/min/1.73m2. Which medication is most appropriate for glycemic control in this patient?
 - a. Metformin
 - b. Sulfonylurea
 - c. Insulin
 - d. SGLT2 inhibitor
 - e. DPP-4 inhibitor
- 40-year-old woman with newly diagnosed type 2 diabetes is started on lifestyle modifications and metformin. After 3 months, her HbA1c remains at 8.0%. What is the next step in her management?
 - a. Increase the dose of metformin
 - (6) Add a sulfonylurea > md line
 - c. Add an SGLT2 inhibitor
 - d. Initiate insulin therapy
 - e. Perform a pancreas transplant
- 47.A 28-year-old woman with type 1 diabetes presents with nausea, abdominal pain, and fruity breath odor. Arterial blood gas 7.35-7 shows pH of 7.25, HCO3 of 15 mmol/L, and an anion gap of 22. What is the primary metabolic derangement?
 - a. Lactic acidosis
 - b. Hyperchloremic acidosis
 - (c.) Diabetic ketoacidosis
 - d. Metabolic alkalosis

29_A 30-year old married male has presented to Andrology Clinic with presenting complaint of unable to attain erection for last 6 months. On further enquiry patient is hypertensive and is on Losartan. 150-200 Examination is not remarkable. The penile buckling pressure during nocturnal penile tumescence is 100 mm.Hg.What is the most likely cause on Impotence?

a. Drug Induced

b. Neurogenic

Psychogenic (d) Vasculogenic - due to HIM.

e. Endocrinopathy

- 30. A 40 year-old lady G6P5 had undergone difficult TAH. On 7th post operative day, she developed left flank and hypogastic pain. On 8th post operative day she developed urinary incontinence as well as normal voiding pattern. The most likely diagnosis is:
 - a. Vesicovaginal fistula
 - 6 Dureterovaginal fistula
 - c. Urethrovaginal fistula
 - d. Genuine stress incontinence
 - e. Complex Genitourinary fistula
- 31. A 30 year -old patient had history of fall. He is now complaining of pain in hypogastrium. FAST revealed abnormality. Urine RE suggests Numerous RBC. The most appropriate analgesic which will relieve his pain by 50 % according to Adapted Oxford League Table of Analgesic Efficacy is:
 - a. Diclofenic 100mg b. Ibuprofen 400mg - Mild pain

c. Tramadol 100mg

(Ketorolac 10 mg - moderate to sever

e. Nalbuphine 10mg

32. You have received a called from General Surgical OT. They have opened a patient as Laparatomy for blunt trauma abdomen with spleen rupture. They have performed splenectomy. On your arrival in OT, There is a huge retroperitoneal hematoma on left side. The blood pressure of the patient is 100/70mm.Hg, Pulse 120/min. What is the most preferred imaging modality on OT Table before deciding exploration of retroperitoneal haematoma?

(Ultrasound

- b. X ray KUB
- c. IVU
- d. CT KUB
- e. MRI Abdomen
- 33.A 8 years old child presents with complaints of generalized body edema from the last 6 days with decreased urinary output and abdominal distension. On investigations there is urine protein to

creatinine ratio of 5.7, urine protein a. RBC's 1-2/HPF. Most likely diagnosis is a. Nephrotic syndrome

b. Barter Syndrome

c. IGA nephropathy d. Post streptococcal Glomerulonephritis

e. Renal tubular acidosis

34.One year old child presents with failure to thrive. On examination height weight are less than the 5th percentile. On investigation there is hyponatremia, hypokalemia, ABGs (metabolic Alkalosis) urinary Ca, Na, K (Increased), remin Level increased, and abdomoinal ultrasound shows nephrocalcinosis.

a. Nephrogenic diabetes insipidus

b. Central diabetes insipidus

c. pRTA (d.) Batter Syndromer e. dRTA

35.A 5 month old child has poor weight gain . 1 Adesteron

although his feeding is adequate. The child has has no illness. The examination is normal except for the childs weight loss (fallure to thrive). Laboratory investigation show normal blood counts. Serum celectorlyte levels are sodium 140 mEq/1, 136-145

chloride 105mEq/1, potassium 3.5mEg/1, bicabonate 170mEq 1, Urinalysis reveals a pH of 8. Plain abdominal X-ray shows medullary nephrocalcinosis

May be La. Central diabetes insipidus its 17 Mephrogenic diabetes insipidus c. Bartter Syndrome

SORTA d. UTIE.

(e) Renal Tubular Acidosis

36.A 10 year old boy presents with excessive urination and thirst. No other family member has this complaint. OA urine analysis shows no glucosse and ketones. Urine specific gravity is 1.005 his urinary concentration improve when parenteral DDAVP in administered.

(a) Central Diabetes Insipidus b. Nephroginic Diabetes Insipidus

c. Renal Tubular Acidosis

- d. Batter Syndrome
- e. UTI
- 37.A 4 year old child presents with failure to thrive, frequent urination, excessive thirst. Weight has decreased 4 kg in the past 4 months. Other family members have similar histories for many years. Urine analysis shows no glucose, Ketones, or evidence of a urinary tract infection. Specific gravity is less than 1.005. Urine not concetrates when parenteral DDAVP is administered.
 - a. Central Diabetes insipidus

the following medications is most likely responsible for this adverse effect? Clisinopril - ACF7

b. Amlodipine

c. Metoprolol

d. Losartan

e. Hydrochlorothiazide

- 20 A 60-year-old male presents with a sudden-onset, severe headache and visual disturbances. On fundoscopic examination, there is evidence of bilateral optic disc swelling. Non-contrast CT scan of the head is normal. What is the most likely
 - a. Central retinal artery occlusion

b. Open-angle glaucoma

© Papilledema

d. Acute angle-closure glaucoma

e. Ischemic optic neuropathy

- 21.A 30 year old male presented with a 6 Days history of Gastroenteritis, Excessive Vomiting. On Examination He is mildly dehydrated, with Acidotic Breathing investigation shows Urea 250mg/dl Creatinine 2.5 mg/di, Urine Output is 4.5 Litres /Day .He was given Gentamycin in the Periphery. What is the most likely acute Tubular Necrosis - Toxin + ischemia
 - b. Focal Segmental Glomerunecrosis

c. Acute Nephritic Syndrome

d. IgA Nephropathy

e. Nephrotic Syndrome

- presents with 22.A 45-year-old male recurrent episodes of excruciating pain in his right great toe. The affected joint is red, swollen, and extremely tender to touch. Laboratory tests reveal an elevated serum uric acid level. What is the most likely diagnosis?
 - a. Osteoarthritis
 - b. Rheumatoid arthritis

(c) Gout

- d. Pseudogout (calcium pyrophosphate deposition disease)
- e. Ankylosing spondylitis
- 23. A 55 year old multyiparous woman has urge incontinence. Urinanalysis is normal and physical exam reveals grade 3 Urodynamics cystocele. reveals bladder contractions involuntary incontinence and a postvoid residual residual of 100ml and a detrusor pressure of 50cm of H2O at maximum flow of 8ml/sec. when cystocele is reduced, no stress incontinence is elicited. The next step is
- a. Oxybutynin

b. Pubovaginal sling -> case of stress

d Anterior colporrhaphy e. Anterior colporrhaphy and pubovaginal sling

61 year old lady becomes incontinentimmediately after transvaginal repair of grade 3 cystocele. This is most likrly due to

a. Detrusor instability

b. Partial bladder denervation (c.)Underlying urethral deficiency-

d. latragenic urethral damage

e. latragenic bladder neck injury

25. A 55 year old female underwent mid urethral sling for stress incontinence Smonths ago. She now has dysuria urgency and frequency despite antibiotic treatment for 2 documented UTIs. Urinanalysis shoes 2-3 rbs/hpf. Pelvic US reveals 50ml of PVR. Next step will be

a. Uroflowmetry

b. IVP

c. VCUG

d. Filling cystometry

(e.)Cystoscopy

26. A 74 year old woman with SUI and detrusor instability would like to avoid surgery. The best pharmacologic approach

a. Ditropan - (oxy butyn)

a. Ditropan - (oxy butyn)

B) Detrositol - (Toltoodin) - Most switch &

c. Imipramine

elderly

elderly

e. Ephedrine

27. A 59 years old male presents with LUTS and BOO with IPSS score of 17. He is known case of COPD. His rectal exam reveals a grossly enlarged clinically benign prostate.. QOL is 4. USG suggests 85 gm prostate with normal upper tracts. What will be the most preferred medical treatment for the patient?

a. Saw Palmetto

Combination Therapy — De tigget d. Aromatase Inhibitors

e. 5-alpha Reductase inhibitor

28. A 75 year-old man with mature cataract of left eye, has been postponed from the OT list for floppy iris as contraindication for the ophthalmic surgery. According to the patient, he has been on alpha receptor blockers for volding symptoms due to benign prostatic enlargement. Which of the alpha blocker is most likely involved in this ophthalmic complication:

- a. Silodosin
- b. Alfuzosin
- c. Terazosin
- d. Doxazosin

Drawn . Tam wisin

g/dL and further testing shows a low reticulocyte count and normocytic anemia. Question: Which of the following is the most appropriate treatment for her

Due to

Renal Fall Erythropolesis-stimulating agent (ESA)

VErthrop of The Blood transfusion

- 10.A 30-year-old woman presents with dull, intermittent flank pain and a history of hypertension. Physical examination reveals bilateral palpable kidneys. She mentions that her father had a similar condition and eventually required dialysis. Laboratory tests show elevated serum creatinine. Which of the following is the most likely diagnosis?
 - a. Autosomal recessive polycystic kidney disease
 - Autosomal dominant polycystic kidney disease
 - c. Renal cell carcinoma
- d. Chronic pyelonephritis
- e. Medullary sponge kidney
- 11.A 35-year-old male presents to the emergency department with sudden-onset severe headache, nausea, and vomiting. His medical history includes hypertension and a diagnosis of Adult polycystic kidney disease . On examination, his blood pressure is 180/110 mmHg, and he has neck stiffness. What is the most likely cause of his symptoms?
 - a. Meningitis
- b. Subarachnoid hemorrhage due to ruptured cerebral aneurysin assoudled
 - c. Migraine headache

WILL APKD

- d. Chronic subdural hematoma
- e. Acute pyelonephritis
- 12.A 70-year-old male with a history of benign prostatic hyperplasia (BPH) presents with fever, chills, and dysuria. He has suprapuble pain and complains of incomplete bladder emptying. Urine culture is positive for E. coli. What is the most likely predisposing factor for his UTI?
 - Recent sexual activity
 - b. Benign prostatic hyperplasia
 - c. Diabetes mellitus
 - d. Dehydration
 - e. Use of NSAIDs
- 13.A 30-year-old woman presents with fever, chills, flank pain, and dysuria. Urinalysis reveals pyurla and white blood cell casts. She reports a similar episode six months ago. What is the most appropriate diagnosis? Clossic Told

a. Cystitis

b, Urethritis Acute pyelonephritis d. Urethral syndrome

14. The following is not an association of

a. Mitral Regurgitation
b. Mitral Stenosis
C. Aortic Regurgitation
d. Sub Arachnoid Haemorrhage
e. Colonic Diverticula

15.A 65-year-old man with a history of the Wall Valve
hypertension and diabetes presents with hypertension and diabetes presents with . HTN nausea, Laboratory results show elevated blood urea nitrogen (BUN) and serum creatinine levels. Physical examination reveals pericarditis and pleuritis. What is the most likely cause of these findings?

a. Acute tubular necrosis

6. Chronic kidney disease

c. Nephrolithiasis

d. Acute interstitial nephritis

e. Nephrotic syndrome

16.A 13 year old boy presented with a 3 day History of abdominal pain, rash over the trunks buttocks and legs. The B.P is 140/90 mmhg. Urine R/E shows 2+ albumin and gross Hematuria. What is the most likely diagnosis?

a. Minimal Change disease

b. Acute Post Streptococcal G.N

c. Focal Segmental Glomerulosclerosis

d. Acute interstitial Nephritis

(e) Henoch-Schonlein Purpura

17.A 30-year-old female presents with fatigue, pale skin, and shortness of breath on exertion. Laboratory results show a low hemoglobin level, low mean corpuscular volume (MCV), and an

↑ reticulocyte count. Peripheral blood smear reveals schistocytes. What is the most likely diagnosis.

a. Iron-deficiency anemia

b. Thalassemia

CHemolytic uremic syndrome - Amemia, uremia. Ilig

d. Sickle cell anemia

e. Autoimmune hemolytic anemia

18. Which of the following Is not a cause of

Anaemia in C.R.F?

a. Erythropoietin Deficiency

c. Upper G.I blood loss - criemic platelits
d. Iron Deficiency

e. Aplastic Anaemia

19. A 55-year-old male with a history of hypertension is started on a new medication. After a few weeks, he develops a persistent dry cough. Which of

+ Retic count

· Schistorytes.

- Total Marks: 120
- Please write your roll numbers on this question paper as well as your answer sheets. Only use black or blue pen to mark your answers
- Choose the best answer among the five given options
- You have to submit the question papers back along with the answer sheet.
- 1.A 55-year-old diabetic patient presents with swelling of the feet, proteinuria, and elevated cholesterol levels. Fundoscopy shows diabetic retinopathy. A kidney biopsy reveals podular glomerulosclerosis. What is the most likely diagnosis?
- a. Minimal change disease
- b. Focal segmental glomerulosclerosis
- Amyloidosis
- (d) Diabetic nephropathy
- e. Membranous nephropathy
- 2.A 10-year-old boy presents with generalized body edema especially around eyes and lower legs. Laboratory findings reveal proteinuria (>3.5 g/day) and hypoalbuminemia. His lipid profile shows hyperlipidemia. His urine examination reveals fatty casts What is the most likely underlying cause of his nephrotic syndrome?
 - a. Henoch Shonlein Purpura

Minimal change disease > Most common

d. Diabetic nephropathy

e. IgA nephropathy

- 3.A 15-year-old man presents with hematuria, mild proteinuria, hypertension, and periorbital edema. His recent history includes a sore throat two weeks ago, Laboratory tests reveal decreased C3 C3 -V levels. What is the most likely diagnosis?
 - a. Goodpasture syndrome
 - b. IgA nephropathy
 - © Post-streptococcal glomerulonephritis
 - d. Minimal change disease
 - e. Focal segmental glomerulosclerosis
 - presents boy 4.A 14-year-old generalized edema, hypertension and colacolored urine. His mother reports that he had an episode of impetigo two weeks prior. Urine analysis shows red blood cell casts and proteinuria. What is the most likely cause of this presentation?
 - IgA nephropathy

(b) Post-streptococcal glomerulonephritis

- c. Membranous nephropathy
- d. Minimal change disease
- e. Focal segmental glomerulosclerosis
- 5.A 45-year-old man presents with swelling in his legs and hematuria. Blood pressure is elevated, and he has a history of systemic lupus erythematosus. Laboratory tests show red blood cell casts in the urine and a low complement level.

Which renal pathology is most consistent with these findings?

. Membranous nephropathy

(b) Lupus nephritis

- c. IgA nephropathy
- d. Diabetic nephropathy
- e. Focal segmental glomerulosclerosis
- 6.A 60-year-old man presents to the emergency department with fatigue, decreased urine output, and mild swelling in his lower limbs. He reports taking lbuprofen daily for joint pain over the past two weeks. Laboratory results show elevated serum creatinine. Which of the following is the most likely cause of his acute kidney Injury?
 - a. Prostatic carcinoma
 - b. Renal cell carcinoma
 - Multiple myeloma

(d.) NSAID-induced renal injury e. Urinary tract obstruction

Analgosic puphopally

7.A 45-year-old woman with a history of hypertension presents with acute diarrhea after returning from a camping trip. She reports reduced oral intake and poor hydration. Her vital signs reveal low blood pressure and tachycardia. Her urine output has significantly decreased over the past 24 hours. Which is the most likely underlying mechanism of her acute kidney

a. Immune-mediated glomerulonephritis

(b.) Pre-renal azotemia due to volume - Dehy chration depletion

- c. Intrinsic renal failure from tubular
- d. Post-renal obstruction from urolithiasis
- e. Acute interstitial nephritis from drug IISP
- 8.A 65-year-old man with a 15-year history of poorly controlled hypertension presents with fatigue, anorexia, and swelling in his legs. Blood tests reveal an elevated serum creatinine of 3.5 mg/dL and a GFR of 25 Urinalysis m². mL/min/1.73 Ston of ed proteinuria but no hematuria. Question: What is the most likely cause of this patient's chronic renal failure? > Dabates & HIN

Strep Pygenisa Diabetic nephropathy

(b. Hypertensive nephrosclerosis

- c. Polycystic kldney disease
- d. Obstructive uropathy
- e. Acute tubular necrosis
- 9.50-year-old woman with chronic kidney disease is being evaluated in the outpatient department. She reports severe fatigue and pallor. Her hemoglobin is 8
